

ABSTRACT OF THE DISCLOSURE

The Mosquito Pipe dispenses a continuous curtain of citronella fumes along the length of the pipe by the placement of the multiple wicks. The continuous curtain of fumes begins a few inches above the Mosquito Pipe and extends upwards several feet in the air depending upon the wind speed. Citronella oil is administered in one end of the Pipe and is dispensed to eight or more wicks and, when lit, the fumes combine to form a curtain creating a more effective mosquito barrier.
